Task 1 (20%) (Continuous time optimal control)

Given an LQ optimal control objective defined over a finite time horizon, i.e.,

$$J = \frac{1}{2}x(t_1)^T S x(t_1) + \frac{1}{2}\int_{t_0}^{t_1} [y^T Q y + u^T P u] dt, \tag{1}$$

where $S \in \mathbb{R}^{n\times n}$, $Q \in \mathbb{R}^{m\times m}$ and $P \in \mathbb{R}^{r\times r}$ are symmetric weighting matrices.

a) Consider a given discrete state space model

$$\dot{x} = Ax + Bu, \tag{2}$$

$$y = Dx, \tag{3}$$

for a process. Find the optimal control which minimize the objective, J, given by (1) subject to the model (2) and (3).

The solution should consist of:

1. An expression for the optimal control vector, u^*.
2. A Riccati equation.
3. A final value condition for the Riccati equation.

b) Consider now an infinite horizon LQ control objective as follows

$$J_i = \frac{1}{2}\int_0^{\infty} [x^T Q x + u^T P u] dt, \tag{4}$$

and the model as in (2) and (3) above.

What is now the solution to the LQ optimal control problem?

c) Give an outline of how to chose the weighting matrices, Q, and, P ?

d) What is the requirements for the closed loop system to be stable ? Tips: The answer involves all matrices A, B, D, P, Q.

Task 2 (10%) (Discrete time optimal control)

Given an LQ optimal criterion defined over the time interval $0 \leq k \leq \infty$, i.e.,

$$J_0 = \frac{1}{2}\sum_{k=0}^{\infty} [y_k^T Q y_k + u_k^T P u_k], \tag{5}$$

where $Q \in \mathbb{R}^{m\times m}$ and $P \in \mathbb{R}^{r\times r}$ are symmetric weighting matrices.

a) Assume now that the system is modeled with a state space model with a direct feed-through in the output equation, i.e.,

$$x_{k+1} = Ax_k + Bu_k, \tag{6}$$

$$y_k = Dx_k + Eu_k. \tag{7}$$

Find the optimal controller which are minimizing the objective J_0 given by (5) and subject to the model (6) and (7)

The solution should consist of:

1. An expression for the optimal control u_k^*.
2. A discrete Riccati equation.

Task 3 (30%) (Discrete time LQ optimal control with Integral Action)

We are in this task to study an LQ optimal controller for a system described by the state space model

$$x_{k+1} = Ax_k + Bu_k + v, \tag{8}$$

$$y_k = Dx_k + w, \tag{9}$$

where v and w are constant and unknown disturbances.
Subject to the above state space model we want to design an LQ optimal controller which minimizes the following LQ criterion

$$J_i = \frac{1}{2}\sum_{k=i}^{\infty}((r-y_k)^T Q(r-y_k) + \Delta u_k^T P \Delta u_k). \tag{10}$$

where $\Delta u_k = u_k - u_{k-1}$ and r is a constant reference vector. Q and P are symmetric and positive semidefinite matrices.

a) Show that it is possible to write the model in (8) and (9) on deviation form, i.e.,

$$\Delta x_{k+1} = A\Delta x_k + B\Delta u_k, \tag{11}$$

$$\Delta y_k = D\Delta x_k, \tag{12}$$

where

$$\Delta x_k = x_k - x_{k-1},\ \Delta u_k = u_k - u_{k-1},\ \Delta y_k = y_k - y_{k-1}. \tag{13}$$

What can be gained by doing this?

b) Show that the model in (11) and (12) can be written as follows

$$\tilde{x}_{k+1} = \tilde{A}\tilde{x}_k + \tilde{B}\Delta u_k, \quad (14)$$
$$\tilde{y}_k = \tilde{D}\tilde{x}_k, \quad (15)$$

where

$$\tilde{x}_k = \begin{bmatrix} \Delta x_k \\ r - y_{k-1} \end{bmatrix}, \quad \tilde{y}_k = r - y_k. \quad (16)$$

Here you should define the matrices $\tilde{A}$, $\tilde{B}$ and $\tilde{D}$.

c) The state space model in 2b) and the LQ criterion in (10) defines a standard discrete LQ optimal control problem of the form

$$\tilde{x}_{k+1} = \tilde{A}\tilde{x}_k + \tilde{B}\tilde{u}_k, \quad (17)$$
$$\tilde{y}_k = \tilde{D}\tilde{x}_k, \quad (18)$$

with LQ criterion

$$J_i = \frac{1}{2}\sum_{k=i}^{\infty}(\tilde{y}_k^T Q \tilde{y}_k + \tilde{u}_k^T P \tilde{u}_k), \quad (19)$$

where we for simplicity has defined

$$\tilde{u}_k = \Delta u_k. \quad (20)$$

Write down the solution to the LQ optimal control problem, of the form

$$\tilde{u}_k^* = \tilde{G}\tilde{x}_k. \quad (21)$$

the solution should consist of:

1. A discrete Riccati equation
2. an expression for the controller matrix $\tilde{G}$.
3. Write down an expression for the actual control of the form

$$u_k = f(\cdot) \quad (22)$$

which are to be used in order to control the process.

Task 4 (10%) (Zeroes in MIMO systems)

The transfer function description of a linear dynamic system is given as

$$sx = Ax + Bu, \quad (23)$$
$$y = Dx + Eu, \quad (24)$$

a) Describe a generalized eigenvalue method for computing the transmission zeroes of a linear dynamic system from the given model matrices (A, B, D, E).

Appendix

Continuous time optimal control

$$\begin{aligned} \dot{x} &= f(x,u,t) && (25) \\ J &= S(x(t_1)) + \int_{t_0}^{t_1} L(x,u,t)dt && (26) \end{aligned}$$

The continuous time Maximum Principle

$$\begin{aligned} H &= L + p^T f && (27) \\ \dot{p} &= -\frac{\partial H}{\partial x} && (28) \\ p(t_1) &= \frac{\partial S}{\partial x}|_{t_1} && (29) \end{aligned}$$

Discrete time optimal control

$$\begin{aligned} x_{k+1} - x_k &= f(x_k, u_k, k) && (30) \\ J_i &= S(x_N) + \sum_{k=i}^{N-1} L(x_k, u_k, k) && (31) \end{aligned}$$

The discrete time maximum Principle

$$\begin{aligned} H_k &= L(x_k, u_k, k) + p_{k+1}^T (x_{k+1} - x_k) && (32) \\ p_{k+1} - p_k &= -\frac{\partial H_k}{\partial x_k} && (33) \\ p_N &= \frac{\partial S}{\partial x_N} && (34) \end{aligned}$$

Derivation rules

$$\frac{\partial}{\partial x}(Qx) = Q^T, \quad \frac{\partial}{\partial x}(x^T Q x) = Qx + Q^T x \qquad (35)$$

$$\frac{\partial}{\partial x}((r - Dx)^T Q (r - Dx)) = -2D^T Q (r - Dx) \qquad (36)$$
